

Upholstery, metals, glass and stone

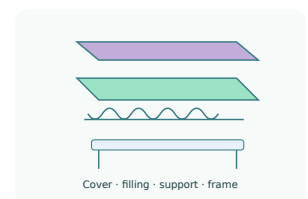

Complementary materials serve different roles. Separate upholstery, cushioning, surfaces and supports, then review the actual products, their interfaces and maintenance requirements.

What you will accomplish

- Separate cover, cushioning and support
- Review interfaces between different materials
- Document use, care and maintenance

Separate cover, cushioning and support

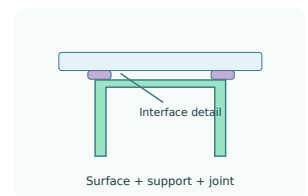

In an upholstered seat, specify cover, liner, filling, support and frame separately. Request fabric identification, intended use and cleaning instructions, filling data and a seating sample. A fabric colour or one foam property is not a complete comfort specification. Review the assembly and whether covers can be maintained or replaced.

Each layer has a role; assess the assembly together.

Review interfaces between different materials

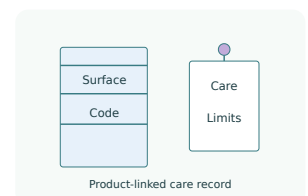

For glass or stone on a metal base, identify the product, dimensions, support and connection system. Request edge, protection and joint details for the selected assembly. Do not infer thickness or capacity from a photograph. Obtain supplier data and technical review, including installation access and possible disassembly.

The material interface needs a reviewed connection detail.

Document use, care and maintenance

Link each surface to its use environment and declared care method, considering liquids, abrasion and light exposure. Record product limits instead of a general durability claim. Review samples according to supplier instructions and identify replaceable parts. Deliver material codes and care information so maintenance does not depend on guesswork.

Care records belong to identified products.

Worked case and decision

A client selects a chair from an appealing photograph. Filling, support and removable-cover details are unknown. Daily use and frequent cleaning require evidence beyond the image.

Decision: request layer specifications, care information and a seating sample before approving the upholstery system.

Check understanding

Does changing fabric establish chair comfort?

- Yes, always
- No; filling, support, frame and user also need review
- A darker colour proves comfort

Correct: No; filling, support, frame and user also need review. The cover is one component; it does not prove the whole seat fits the user.

Lesson questions

Should I test an arbitrary cleaner on the sample?

Follow the product's permitted care and test instructions; do not generalise one sample result to other surface systems.

Practice

Create a seat-layer schedule and an interface information sheet for a surface on a different-material base.

Layers and product identities

Interface detail and missing data

Care and replacement

Review your work against the criteria. Saving it does not constitute technical project approval.

- Cover and filling are separate
- Capacity is not inferred from appearance
- Care instructions identify the product
