

Inspect, hand over and resolve defects

Inspection connects an observed result to an agreed criterion. Learn to record a defect, its corrective action and reinspection so that handover is supported by evidence.

What you will accomplish

- Link each check to an acceptance criterion
- Write an actionable defect record
- Reinspect before closing handover

Link each check to an acceptance criterion

Group checks into dimensions, alignment, finish, operation, completeness and access. Assign an approved drawing, sample, system document or project requirement to each. Record the method and result rather than a vague quality statement. If a criterion is missing, flag it for agreement before judgment; do not invent a numerical tolerance to fill the form.

Check	Reference	Result
Size	Drawing	?
Finish	Sample	?
Motion	System	?

No judgment without a criterion

Check item + reference + method + result.

Write an actionable defect record

Give the issue an ID, unit/part location, observed condition, reference and photograph where useful. Record its effect, the responsible reviewer and due date. “W02 door rubs the side during opening” can be rechecked; “bad door” cannot. Identify the cause before selecting a remedy rather than replacing a sound part solely because the symptom appears there.

A specific location and observable condition make the issue actionable.

Reinspect before closing handover

After correction, repeat the acceptance check and record the result, date and reviewer. Check whether the change affects adjacent gaps or drawer movement. An issue closes on reinspection evidence, not a message saying “fixed.” Handover includes final documents, use/care instructions and outstanding items with responsibilities. A signature does not resolve an issue affecting safe use.

Correction → reinspection → documented closure.

Worked case and decision

Issue D04 records rubbing at the W02 door. The approved correction has been carried out, but reinspection is outstanding. Its status is “corrected, awaiting verification.” Close it only after the movement and adjacent conditions meet the criteria and the result is recorded.

Decision: keep D04 open until reinspection is documented.

Check understanding

What closes an issue after correction?

- Documented reinspection against the criterion
- A message saying fixed
- Changing the handover date

Correct: Documented reinspection against the criterion. Carrying out a correction does not establish its result; reinspection does.

Lesson questions

Can a check be marked accepted without a criterion?

A defined reference is needed. Record the missing criterion and obtain agreement before judging the result.

Practice

Prepare the D04 issue record through correction and reinspection, plus three handover-document items.

Issue, criterion and location

Correction and responsible reviewer

Reinspection and handover status

Review your work against the criteria. Saving it does not constitute technical project approval.

- Observable description
- Closure supported by evidence
- Outstanding items assigned
