

Kitchen activity zones and layout

A kitchen layout connects storage, washing, preparation, cooking and serving. Compare alternatives against the same users, use scenario and movement requirements.

What you will accomplish

- Map the work zones
- Test openings and movement
- Compare with consistent criteria

Map the work zones

Map a meal from retrieving ingredients through washing, preparation, cooking and serving, including returning utensils and handling waste. Multiple users or appliances change these relationships. A three-point triangle may support analysis but cannot by itself validate the entire kitchen.

Include work, serving and return paths.

Test openings and movement

Draw open appliance doors and drawers with standing and walking positions. Test credible simultaneous activities, such as preparation and retrieval. Closed-door space does not establish usable space during opening. Give every conflict a code, affected elements and triggering use state.

Review simultaneous use, not only a static gap.

Compare with consistent criteria

Compare feasible alternatives against user routes, usable preparation surface, appliance opening, service access and storage. Attach plan evidence and flag missing site or device data. More cabinets or a more expensive appearance does not automatically improve the layout.

A plan and conflict log justify the decision.

Worked case and decision

A preparation drawer conflicts with the dishwasher door in A. B resolves the conflict but reduces preparation surface. Record that trade-off and check the remaining surface with the user before selecting it.

Decision: resolve the conflict while retaining the required preparation function.

Check understanding

What best supports layout acceptance?

- Use-state plans and conflict records
- More cabinets
- A triangle alone

Correct: Use-state plans and conflict records. The evidence must address actual work and movement.

Lesson questions

Does a work triangle validate the kitchen?

No. Review the complete tasks, users, devices and movement states.

Practice

Submit two layouts, a meal scenario, three opening states and a conflict/decision record.

Map the work zones

Test openings and movement

Compare with consistent criteria

Review your work against the criteria. Saving it does not constitute technical project approval.

- Same brief for both alternatives
- Simultaneous states tested
- Evidence-based decision
