

Turn a custom idea into a reviewable specification

A bespoke concept becomes reviewable when its function, envelope, material and verification are explicit. Build a brief, compare alternatives on shared criteria and define what a prototype must resolve.

What you will accomplish

- Translate wishes into requirements
- Compare alternatives on equal terms
- Define the prototype question

Translate wishes into requirements

Record the user, stored contents, movement, site envelope and delivery route. Separate surveyed dimensions from proposals and missing information. Give every requirement an acceptance observation: opening a door, retrieving an item or matching a finish sample. Revisit these links when appearance changes so that function and scope do not drift silently.

User need	Acceptance evidence
Retrieve file	Reach trial
Delivery	Opening survey
Form / finish	Reference sample

Mark known, proposed and open

Requirement, evidence and open information remain distinct.

Compare alternatives on equal terms

Compare rectilinear and curved options against the same storage and delivery needs. Record consequences for parts, edges, support and service access. Reject failure of essential requirements before aesthetic scoring. Changing a surface finish is not equivalent to changing the carcass: a new construction form reopens relevant fabrication and connection details.

Shared requirements expose different construction consequences.

Define the prototype question

Define the prototype question, scale, material and limits. A volume mock-up may show reach and collisions but does not establish the strength of the final connection. Record the observation, affected requirement, revision and reviewer. Prototype acceptance applies to the question actually tested, not every untested aspect of the product.

State what the prototype did and did not establish.

Worked case and decision

Changing a straight front to a curved one causes a drawer collision in the mock-up. Revisit movement and detailing before polishing the rendering; the failed requirement is functional access, not colour.

Decision: resolve drawer movement before accepting the form.

Check understanding

Does a successful cardboard volume model prove joint strength?

- No; that requires separate verification
- Always
- If the colour matches

Correct: No; that requires separate verification. The tested question and material limit the conclusion.

Lesson questions

Can an image start the brief?

Yes, as inspiration; then define function, constraints and evidence.

Practice

Submit a bespoke brief, two comparable options and a focused prototype plan.

Requirements and evidence

Alternative comparison

Prototype scope

Review your work against the criteria. Saving it does not constitute technical project approval.

- Surveyed facts distinguished
- Shared comparison criteria
- No unsupported prototype claims
