

A complete media cabinet project

An integrated media-unit package connects viewing needs, equipment, structure, services, quantities and inspection. Make every change traceable across the documents it affects.

What you will accomplish

- Freeze the project brief and references
- Link geometry, quantities and services
- Prepare installation and acceptance checks

Freeze the project brief and references

Record users, viewing position, device models, storage and site survey. Separate confirmed data from assumptions; an unselected device size must not become a manufacturing release. Refer back to screen and unit decisions, and assign substrate, fixing and service reviews. An attractive elevation does not establish equipment compatibility or wall suitability.

Show unresolved inputs explicitly before drawing release.

Link geometry, quantities and services

Use the same unit codes in plan, elevation, section and parts list. Show structure, finish build-up and service paths, linking materials to products, samples and edges. A deeper device may affect the compartment, back, cable space, shelf and cut parts. Update affected documents under one revision; changing only the presentation elevation leaves a conflicting package.

One change can affect several coordinated documents.

Prepare installation and acceptance checks

Plan delivery, assembly and fixing/service checks before closure. Assign references and reviewers for motion, alignment, finish, ventilation and maintenance access. Secure equipment and furniture using the approved system and substrate conditions; weight alone does not prove tip-over resistance. Handover includes final drawings, product identities, care instructions and outstanding items.

A coordinated package includes evidence and unresolved items.

Worked case and decision

A deeper device replaces the selected model after the elevation is approved. Review section, connections, ventilation and affected parts, then issue a coordinated revision. The finish sample may remain valid if that system is unchanged, but it does not establish that the new equipment fits.

Decision: revise affected documents and verify them before production release.

Check understanding

What needs review when a deeper device is selected?

- Section, services and affected parts
- Only elevation colour
- Only the filename

Correct: Section, services and affected parts. Equipment depth affects geometry, service space and potentially part dimensions.

Lesson questions

Is an elevation enough for manufacturing release?

No. Coordinated sections, details, parts, materials and services are also needed.

Practice

Prepare the package index, a device-change record and three referenced inspection items.

Confirmed and pending inputs

Affected drawings and schedules

Inspection and handover

Review your work against the criteria. Saving it does not constitute technical project approval.

- Consistent codes/revisions
- Change effects traced
- Referenced acceptance
