

Plan children's rooms around activities

Plan a room for two school-age children around sleeping, playing, studying and storage. Coordinate movement, foreseeable hazards and changing needs rather than beginning with a colour theme.

What you will accomplish

- Define both children's activity needs
- Connect zones and review hazards
- Plan growth without improvised conversion

Define both children's activity needs

Record each child's activities, schedules, belongings and assistance needs. Similar ages do not establish identical reach or preferences. Separate shared and personal areas. This project concerns school-age users; infant and toddler sleeping products require distinct classifications and requirements. Turn the family's brief into a reviewable programme before choosing a furniture arrangement.

Individual needs first, then shared-space decisions.

Connect zones and review hazards

Connect sleeping, study, play and storage zones to the entrance and open furniture states. Review services, window coverings and objects that encourage climbing. CPSC advises securing furniture/TVs according to manufacturer instructions and removing tempting objects from their tops. A layout does not replace appropriate product selection, assembly and substrate-specific installation review.

Review routes, open states and climbing incentives together.

Plan growth without improvised conversion

Identify changes supported by the product: content rearrangement, a designed adjustable shelf or relocating a unit with renewed restraint review. Distinguish these from modifying a bed or adding an unapproved mechanism. Document a future arrangement and its rechecks rather than promising one piece for every age. Preserve openings and useful shared space after changes.

Adapt within the product's permitted configuration and recheck changes.

Worked case and decision

One child studies while the other plays. Option A places the occupied chair in the entrance route; B relocates study and retains a clear route and personal storage. Develop B, test opening states and review storage restraint against the selected product instructions.

Decision: verify simultaneous tasks, access and hazard controls before acceptance.

Check understanding

Do similar ages prove identical needs?

- No; review each child and their use
- Yes; duplicate the brief
- Yes; choose matching colours

Correct: No; review each child and their use. Activities, reach, assistance and schedules can differ despite similar ages.

Lesson questions

Can the same school-age brief be used for an infant?

No. Users, sleeping-product categories and their requirements differ and need a separate review.

Practice

Prepare individual briefs, two layouts, a simultaneous-use case and a permitted future adaptation.

Each child's needs

Zones, openings and hazards

Growth option and rechecks

Review your work against the criteria. Saving it does not constitute technical project approval.

- No age-only assumptions
- Route clear during use
- No unapproved product conversion
