

Single, multiple and extending beds

Compare a single bed, two separate beds and pull-out or extending systems through access, support and transformation states. A compact closed footprint is not sufficient to approve a mechanism.

What you will accomplish

- Compare sleeping places and use patterns
- Draw closed, transition and occupied states
- Verify mechanism, support and mattress compatibility

Compare sleeping places and use patterns

Define users, sleeping frequency and independent entry/exit. Two separate beds have different envelopes and routes from a single bed or a pull-out lower bed. Check whether the deployed bed blocks a door or drawer. Elevated beds require the separate safety review in the next lesson; lack of floor space does not by itself justify elevating a sleeping place.

Compare occupied sleeping states, not only closed footprints.

Draw closed, transition and occupied states

Draw components before, during and after movement, identifying hand/body paths, pinch/shear locations and the deployed supports. Do not use a child to trial an unverified mechanism. Have the specified system's motion, protection and retention reviewed competently first; assess appropriate use only after acceptance and in accordance with the product instructions.

Transition states need review as well as the final position.

Verify mechanism, support and mattress compatibility

Identify the system, compatible mattress, use limits, required retention/stops, floor conditions and maintenance instructions. A large drawer does not become a bed merely because it pulls out, and wheels do not establish sleeping-load support or stability. Refer changes to length, support or mechanism to the manufacturer or competent reviewer before implementation.

Verify a sleeping system rather than relabeling a drawer.

Worked case and decision

The pull-out option frees daytime space but blocks the entrance route when occupied. Revise the arrangement or compare separate beds against the programme. Do not approve it solely because the closed-state illustration looks more spacious.

Decision: review sleeping, transition and access states before selection.

Check understanding

Which state must be included when comparing a pull-out bed?

- Deployed occupied state and access route
- Closed state only
- Front colour only

Correct: Deployed occupied state and access route. The occupied footprint can obstruct access even when the closed state is compact.

Lesson questions

Can any wheeled drawer serve as a bed?

No. It must be a verified sleeping system with appropriate support, mattress compatibility and stability.

Practice

Compare the bed options and draw closed/transition/deployed states with required compatibility information.

Users and frequency

States and access

Mechanism, mattress and verification

Review your work against the criteria. Saving it does not constitute technical project approval.

- Occupied state included
- Transition hazards identified
- No unverified drawer-to-bed conversion
