

Workstations, sitting and the user

Design a workstation around the user, task and relationships between chair, surface, screen and tools, then document a user trial and dimension sources.

What you will accomplish

- Start with user and task
- Test chair, surface and screen together
- Record the trial and dimension sources

Start with user and task

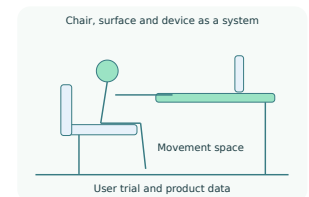

Record tasks such as typing, paper work, calls and presenting, including devices, paper sizes and user-reported frequency. Separate frequently used tools from less-used storage and map reach relationships. One person's station should not automatically become the team-wide solution.

Tasks define tools and access relationships.

Test chair, surface and screen together

Draw chair, surface, screen and leg relationships in section and input devices/paper in plan. Trial reach and movement with the user and review adjustment features under product instructions. Do not prescribe one height/distance for everyone or present the trial as medical diagnosis or treatment.

Review relationships with the actual user and products.

Record the trial and dimension sources

Record user, task, products and the source of each dimension: site measurement, product data or a trial assumption. Compare alternatives with the same task and log observation, change and acceptance. Recheck affected relationships after changing chair or device.

Measurements, assumptions and product data are different sources.

Worked case and decision

A screen base occupies the needed paper area in A. B uses a compatible arm to free it, but introduces mounting requirements. Review screen/arm/surface compatibility and repeat the user task before accepting B.

Decision: improve the task while verifying product compatibility.

Check understanding

What supports workstation acceptance?

- Documented task trial and product data
- An attractive image alone
- One dimension for everyone

Correct: Documented task trial and product data. Acceptance connects tasks, system relationships and dimension sources.

Lesson questions

Do common dimensions validate a workstation?

No. Review the actual user, task, products and site.

Practice

Submit a user/task card, workstation plan/section, comparison trial and dimension-source register.

Start with user and task

Test chair, surface and screen together

Record the trial and dimension sources

Review your work against the criteria. Saving it does not constitute technical project approval.

- Specific user and task
- Coordinated workstation relationships
- Assumptions distinguished from measurements
