

Reception and waiting areas

Reception furniture joins visitor arrival, staff work and waiting. Coordinate queues, service surfaces, privacy and maintainable storage instead of treating the desk and seating as isolated objects.

What you will accomplish

- Coordinate arrival and waiting
- Separate visitor and staff interfaces
- Coordinate privacy and maintenance

Coordinate arrival and waiting

Map first contact, queue, waiting and onward movement from the entrance. Check staff sightlines and conflicts between occupied seats, doors and open storage. Represent relevant visitors with luggage or mobility aids and obtain the applicable access review. A neat row of chairs does not by itself make the service journey clear.

First contact and onward route remain legible.

Separate visitor and staff interfaces

Section the visitor surface, staff worktop, screen and approach space. Lowering one surface alone may not solve access if the base still obstructs use. Identify writing, payment or handover tasks and device positions. Review the actual service against applicable requirements rather than borrowing a domestic desk height as a universal solution.

Service task, approach and device position are linked.

Coordinate privacy and maintenance

Check views of screens and papers from waiting positions and place staff documents in controlled storage. Draw cable access and cover removal from the staff side, avoiding cables across routes. Public/back-of-house zoning supports privacy, but a furniture plan alone does not certify acoustic isolation or data-protection compliance.

Sightlines, storage and service access need coordination.

Worked case and decision

The screen faces waiting seats and the cable cover opens toward the public. Revise screen orientation and service access, then recheck staff drawers and visitor contact. An arbitrary tall barrier may hide the visitor rather than solve the privacy problem.

Decision: test privacy and visitor contact together after revision.

Check understanding

Does lowering the service surface alone establish usable access?

- No; check approach, base and task
- Always
- A new colour is enough

Correct: No; check approach, base and task. Usability includes approach and task, not surface height alone.

Lesson questions

Can a domestic living-room specification be transferred unchanged?

No. Public service, privacy and operating tasks change the requirements.

Practice

Submit a reception plan, service section and sightline/maintenance review.

Arrival and waiting

Service interface

Privacy and cable access

Review your work against the criteria. Saving it does not constitute technical project approval.

- Occupied routes shown
- Tasks distinguished
- Sightlines and access documented
